Spotify History

A little student`s project written in **ANSI C**, which checks what is the current track playing in Spotify Web App. Author: Matthew Grzegorczyk

Basic info

Spotify History is an app written for my student`s project. It's written in *ANSI C*, as I have stated earlier. App only works in Windows as there is no given API from Spotify to check what is the current track you're playing on Spotify and the only possible option at the moment is to check the title window of Spotify.

Features

- Current Song
- History

App saves the current playing track to the **Current song.txt** file. It can be used later for dipslaying info about the currently playing track in software like **OBS** which let's you display text on video from text based files etc.

History is saved in **History.txt** file when app closes. You can close the app by pressing ESC key or simply closing the Spotify app.

Usage

You can download the program - it's just the single *.exe file as it's the console application. App is working only when the Spotify application is running, if not it's closing automatically. If you want to close the application, just focus it and hit ESC key.
